

Installation instructions (Version C.00)

IMPORTANT

These modifications require

Version **7.00.100** (or higher) of AAG_CloudWatcher
&
Version **2.20.320** (or higher) of AAG_WeatherCenter.

1. Configure the weather server of ACP Observatory Control Software to use AAG_CloudWatcher.
 - Please refer to the help of AAG_CloudWatcher section **Working with other programs** subsection **Using with ACP 5.1**.

2. Copy files

- **aAAG_WeatherControl0.asp**
- **aAAG_WeatherControl1.asp**
- **asystemstatus.asp**
- **aweather.asp**

to sub directory

- **WebDocs\ac** located in **c:\Program Files\ACP Obs Control** for ACP 5.1 under Windows XP;
or
- **ACP Web Data\Doc Root\ac** located in **c:\ Documents and Settings\All Users\Documents** for ACP 6.0 under Windows XP;
or
- **ACP Web Data\Doc Root\ac** located in **Libraries\Documents\Public Documents** for ACP 6.0 under Windows 7;

It is strongly advisable to make a copy of the existing files before copying the modified files.

Notes:

- (i) File [asystemstatus.asp](#) has been modified to allow the description of the weather to be consistent with the descriptions defined in AAG_CloudWatcher / AAG_WeatherCenter;
- (ii) File [aweather.asp](#) has been modified to have its link pointing to AAG_WeatherControl;

3. Go to authoring mode in the ACP browser and create a new tiddler and name it

AAG_WeatherControl

with the following content

<<RemoteContent '/ac/aAAG_WeatherControl0.asp'>>

and define tags as

Control UserContent

4. Save tiddler by clicking on **done** and then **save to web**
5. The next three images highlight this procedure.

Authoring System

Windows Internet Explorer browser window showing the AAG_WeatherControl application. The address bar displays `http://localhost/author.html`. The page title is `<%= Prefs.SiteName %> - Welcome <%= User.Name %>`.

The application interface includes a sidebar with navigation links: **Authoring**, **Users see these:**, **Observing**, **My Documents**, **Shared Files**, **Observatory Info**, and **Help Resources**.

The main content area displays the **AAG_WeatherControl** application, created on 25 June 2011. It features a **Help** button and tabs for **Weather Summary**, **Threshold Limits**, **Unsafe Conditions**, and **Graphs**. The version is **CW (v7.00.200)**.

A **Refresh** button is present, along with an **Auto Refresh** section showing settings for **OFF**, **every 10 secs**, **every 30 secs**, **every 60 secs**, and **Last refresh 8:30:20**.

A red box highlights the **Save to web** button. A note states: **NB: Before saving to web define Author, Username and Password under options**.

The right sidebar contains a **search** section with a search bar and a **Test Live** button. Below this is an **options >** section with fields for **Author Name:** (AAG), **Username:** (AAG), and **Password:**. There are also checkboxes for **RegExpSearch**, **Case Sensitive Search**, and **Enable Animations** (checked). The bottom of the sidebar shows **Advanced Options** and **Plugin Manager**.

Modifications to the System Status tiddler

The modifications are shown below and they are done in file *asystemstatus.asp* of the sub directory of ACP

c:\Program Files\ACP Obs Control\WebDocs\ac

The text in blue represents the text that was introduced.

```
//----- AAG modification BEGIN
    var C;
    try {
        C = new ActiveXObject("AAG_ACPWeatherFeed.Weather");
    } catch(ex) {
        C = null;
        Response.Write("AAG_ACPWeatherFeed is not available.\n\n");
        Response.End();
    }
    // We have AAG_ACPWeatherFeed weather server and it's connected
    var ret = "";
    try {
        ret = C.WeatherDescription()
    } catch(ex) {
        ret="Error - Incorrect version";
    }

//
//    var clouds = null;    // [sentinel]
//    var wind = null;     // [sentinel]
//    try {
//        clouds = Weather.Clouds;
//    } catch(ex) { }
//    try {
//        wind = Weather.WindVelocity;
//    } catch(ex) { }
//
//    var ret = "";
//    if(clouds !== null) {
//        if(clouds < 0.2)
```

```
//          ret += "Clear";
//      else
//          ret += "Clouds";
//      }
//      if(clouds != null && wind != null)
//          ret += " ";
//      if(wind != null) {
//          if(wind < 5.0)
//              ret += "Calm";
//          else
//              ret += "Wind";
//      }
//
//-----AAG modification END
```

Note that `//` at begin of the line turns the line into a remark.

So the block of instructions starting at line

```
//      var clouds = null;    // [sentinel]
//.....
```

and up to

```
//-----AAG modification END
```

is fully remarked and consequently the respective instructions are disregarded.

These modifications ensure that the weather description displayed in System Status tiddler of ACP Browser is consistent with the information from AAG_WeatherCenter / AAG_CloudWatcher.
